

# Do you have psoriasis?

Take part in a **short questionnaire** about the willingness to start medication to prevent psoriatic arthritis

Researchers of the Netherlands and the United Kingdom have started a study into the willingness of psoriasis patients to start medication to prevent psoriatic arthritis, a form of inflammatory rheumatism in which someone also has the skin disease psoriasis. Patients can have complaints of the skin and also inflamed joints. There is currently no treatment that can prevent this condition. Researchers from Amsterdam UMC now want to investigate what psoriasis patients would think of possible preventive medication, i.e. medication that can prevent psoriatic arthritis.

If you have psoriasis, the researchers would like to know your opinion. You can fill in the questionnaire, which will take about 20 minutes.

## When can you participate?

- ✓ You are **18 years or older**
- ✓ You have been diagnosed by a doctor as having **psoriasis**
- ✓ You can complete a survey that is in **English**

Please note: if you also have psoriatic arthritis, you cannot participate in the study!

## How can you participate?

- By answering a number of questions, this takes **±20 minutes**
- You can preferably participate on a laptop or computer
- All data collected will remain **confidential** and **anonymous**
- Open the **link** below or use the **QR code**
